EP-A-0032058 discloses 5-aminoalkyl-2-aminothiazoles having antiallergic and antiasthmatic activities, whereas 2-amino-4-methyl-5-(4-phenyl)piperazino-alkylthiazoles having neuroleptic activity are disclosed in Polish patent 106,675 (Chem. Abstr. 95; 97851).

Finally, 4-phenyl-2-aminothiazole derivatives have been studied as local anaesthetic in J. Indian Chem. Soc. 1980, 57, pp 829-832 and 1982, 59, pp 773-5.

The compounds of formula I structurally differ from the prior-art thiazoles in the kind of substitution on the amine nitrogen. From the biological point of view, the distinguishing feature of the compounds of the invention resides in their particular ability in preventing and/or reducing bronchial hyperreactivity of the respiratory tract, thus resolving the phlogistic condition accompanying acute and subchronical inflammations of bronchial mucosa.

The compounds of the invention of formula (I) are prepared from thiazoles of formula (II)

wherein Ar' has the same meanings as Ar, or is a group which can be converted into Ar by removing any protective groups present, by reacting them first with carbonyldiimidazole or, when X is S, thiocarbonyldiimidazole, or similar difunctional

carbonylating agents, then with amines of formula (III):

wherein B is as defined above.

The reaction of compound (II), with carbonyldimidazole or its thioanalogue and amines (III) is generally carried out in anhydrous aprotic solvents, at temperatures ranging from room temperature to the reflux temperature of the reaction mixture. Suitable solvents are ethyl ether, tetrahydrofuran, halogenated hydrocarbons, dimethylsufoxide, dimethylformamide. Of course carbonyldiimidazole can be replaced by similar reagents, such as phosgene or thiophosgene.

Compounds of formula (II) are known or they can be prepared by reacting thiourea with haloacetophenones of formula (IV).

wherein Ar' is as defined above and X is a chlorine, bromine or iodine atom, which compounds are known or can be prepared by widely known methods.

Compounds of formula (III) are widely known or have been described in WO 87/01706.

Compounds of formula (I), as mentioned above, have useful pharmacological properties, particularly for the

treatment of bronchial hyper-reactivity.

Bronchial hyper-reactivity is a clinical symptom of asthma and it is believed to be a direct consequence of an abnormal and latent contractility and sensitivity of the bronchial mucosa.

Bronchial hyper-reactivity can cause acute crisis of asthma after physical practice, and/or after exposure to external stimuli such as the inhalation of fog, pollutants, allergens and autacoids.

The bronchial hyper-reactivity conditions may be simulated by an experimental model consisting in the PAF infusion (600 µg/l) in male guinea-pigs weighing 400-450 g, kept under forced ventilation under urethane and pancuronium bromide anesthesia.

PAF, which is one of the most important mediators involved in the inflammatory process of the airways, after infusion for 1 hour, causes an hyperreactivity reaction (bronchocostriction) to specific and different substances.

The activity of the compounds of the invention, in the considered pharmacological model, is shown by the prevention of the PAF-induced hyper-reactivity, measured as increase of the pulmonary insufflatory pressure (measured according to the modified procedure of Konzett and Rossler, Naun. Schmied. Arch. Exper. Pathol. Pharmacol. 191, 71, 1970).

The compounds of the invention, which are administered 10 minutes before the PAF administration in dosages which vary between 2 and 50 pg/Kg, demonstrate a protective action which lasts at least 4-6 hours and results in a reduction of the PAF-induced hyperreacti-

vity. Such pharmacological effects are dose-related.

From what has been shown above it is clear that the compounds of the invention can be used in human therapy in the treatment of asthmatic and obstructive conditions of the respiratory tract, in the treatment of inflammatory phlogosis. In the intended therapeutic uses, the compounds of the invention will administered in the form of pharmaceutical compositions which can be prepared with excipients and conventional techniques such as, for example, those described in Remington's Pharmaceutical Sciences Handbook, Mack Pub. Co., N.Y., USA, 17th ed., 1985. adapted administration by intramuscular, intravenous, oral, aerosol and rectal methods.

The daily dose will depend on several factors such as the gravity of the pathology and the condition of the patient: it will normally consist of from 1 to 50 mg of a compound of formula I for a patient weighing 70 kg, one or more times a day.

20 The following Examples and Preparations further illustrate the invention.

The 2-amino-4-arylthiazoles (II) are either commercially available or are prepared by reaction of the suitable d-bromoaryl-methylketones with thiourea, as disclosed in the following preparations 1-4.

PREPARATION 1

Acetic anhydride (2.7 ml) is dropped into a solution of 2,3-dihydroxybenzoic acid (2 g) in 10 ml of pyridine, cooling to 0°C. After 6 hours at room temperature, the reaction mixture is poured into 15 ml of 1N HCl and it is repeatedly extracted with AcOEt

(3x50 ml). The combined organic extracts are washed with water, dried over sodium sulfate and the solvent is evaporated off under reduced pressure. The resulting residue (3.5 g) is crystallized from diisopropyl ether to give 2.7 g of 2,3-diacetoxybenzoic acid, m.p. 151-153°.

PREPARATION 2

Carbonyldimidazole (750 mg) is added to a solution of 2,3-diacetoxybenzoic acid (1 g) in 10 ml of anhydrous tetrahydrofuran, with stirring and under inert gas atmosphere. After one hour, the reaction mixture is added with 570 mg of dimethylaminopyridine and 670 mg of Meldrum acid. After 2 more hours, the reaction mixture is poured into 15 ml of 1N HCl and repeatedly extracted with AcOEt (3x30 ml). The combined organic extracts are washed with water, dried over sodium sulfate and solvent is evaporated off under reduce pressure. The resulting residue (1.7 g) is purified by silica gel chromatography (50 g, eluent 8/2 AcOEt/hexane), to obtain 1.4 g of 5-((2,3-diacetoxyphenyl)carbonyl)-2,2-dimethyl-4,6-dioxo-1,3-dioxa-

PREPARATION 3

Paratoluenesulfonic acid mono-hydrate (1.15 g) is added to a solution of 5-((2,3-diacetoxyphenyl)carbonyl)-2,2-dimethyl-4,6-dioxo-1,3-dioxane (2 g) in 10 ml of acetonitrile. After 24 hours, the reaction mixture is poured into a NaHCO₃ saturated solution (20 ml) and repeatedly extracted with AcOEt (3x30 ml). The combined organic extracts are washed with water, dried over sodium sulfate and solvent is

evaporated off under reduced pressure, to obtain 1.1 g of 2,3-diacetoxyacetophenone.

PREPARATION 4

Bromine (0.24 ml) is dropped into a solution of 2,3-diacetoxyacetophenone (1 g) in 10 ml of dioxane, under stirring and keeping temperature at 0-5°C. When dropping is over, the reaction mixture is warmed to room temperature and stirring is continued for one hour, then it is poured into a NaHCO₃ saturated solution (15 ml) and repeatedly extracted with AcOEt (3x30 ml). The combined organic extracts are washed with water, dried over sodium sulfate and solvent is evaporated off under reduced pressure, to give 1.2 g of diacetoxyohenacyl bromide.

Thiourea (360 mg) is added to a solution of 2,3-diacetoxyphenacyl bromide (1 g) in 10 ml of ethanol. After 2 hours, 950 mg of 2-amino-4-(2,3-diacetoxyphenyl)thiazole are separated by filtration.

15

25

30

Following the same procedure of preparation 1 to 20 4, 2-amino-4-(4-acetoxyphenyl)thiazole, 2-amino-4-(4-acetoxy-3,5-di-tert-butylphenyl)thiazole and 2-amino-4-(3,4-diacetoxyphenyl)thiazole are prepared.

EXAMPLE 1

Carbonyldimidazole (920 mg) is added to a solution of 2-amino-4-(2,3-diacetoxyphenyl)thiazole (1.5 g) in 10 ml of anhydrous tetrahydrofuran. After 1 hour, N-(3,6-bis-diethylamino-pyridin-2-yl)piperazine (1.7 g) is added to the reaction mixture. After 2 hours at room temperature, the reaction mixture is poured into a NaHCO₃ saturated solution (15 ml) and repeatedly extracted with AcOEt (3x30 ml). The combined organic

extracts are washed with water, dried over sodium sulfate and the solvent is evaporated under reduced pressure. The resulting residue (3 g) is purified by silica gel chromatography (90 g; eluent 95/5 ACOEt/MeOH), to obtain 2.5 g of N-(3,6-bis-diethylamino-pyridin-2-yl)-N'-(4-(2,3-diacetoxyphenyl)-thiazol-2-yl)aminocarbonyl)piperazine.
